

# Sustainable Fuels

## Electrofuel (e-Fuels)

Synthetic fuels produced from direct air capture of CO/CO<sub>2</sub> and hydrogen electrolysed from water.

E-Fuels re-cycle carbon dioxide captured directly from atmosphere.

## Biofuels

Produced from biomass derived from organic waste and by-products primary processes such as timber processing and food production.

Biofuels re-cycle carbon dioxide captured through natural CO<sub>2</sub> consuming processes such as photosynthesis.
